$\lambda = 500$ nm, NA = 0.05, $M = 1$, $q = 1.5f_c$, $t_0 = 0.5$, $\varepsilon = 0.05$
(a) Same pupil; different quantities are transferred
Coherent field transfer $P(f, 0)$
Incoherent intensity transfer $T(f)$
$q = 1.5f_c$
$T(q) = 0.1443$
Transfer
Spatial frequency f/f_c
(b) Pattern appearance: one common grayscale
Mask $|t|^2$
A: coherent
B: incoherent
Position x/p
I/t_0^2
(c) The coherent image is flat; some incoherent contrast survives
Calibrated intensity I/t_0^2
Position x/p ($p = 6.67\,\mu$m)
Mask $|t|^2$
A: coherent image
B: incoherent image
